

Wireless speech recognition in the ER

When a physician's vision turns into reality

Dr. Rosenthal's vision

Dr. Rosenthal's vision is simple and logical: "We introduced PDA devices that interface with the emergency and patient index system, as well as the speech recognition server. Physicians can now access up-to-date patient data (bed location, priority, chief complaint, etc.) and record their findings all from one single device."

Interfaces between the central admission system, speech recognition server and PDAs.

Simplicity is an in-depth understanding of workflows and technology that allows tailoring systems to the needs of the people who have to use them. "I'm a big believer that technology has to work the way people work," says Dr. Rosenthal, underlining that physicians have a reputation for not being the easiest user group. "We don't buy in quickly – if a system is complicated, we simply won't use it."

Taking the lead

Dr. Stephen E. Rosenthal is a full-time Emergency Medicine specialist, Assistant Director of Medical Informatics, Admissions Coordinator and an Associate Director of the Emergency Department at the Sir Mortimer B. Davis Jewish General Hospital in Montreal, Quebec, Canada.

A technology pioneer who is looking back on 20 years of experience, Dr. Rosenthal initiated, developed and implemented several innovative informatics projects - most recently a wireless document creation and

management system on PDA devices.

Dr. Rosenthal is highly regarded by his peers and the informatics community as a leader and innovator in the field of medical informatics. He is also an active member of the Canada Health Infoway advisory board and has advised the Ministère de la Santé et des Services Sociaux (Quebec Minister of Health) on the new standards for the Emergency Department.

Sir Mortimer B. Davis Jewish General Hospital

Since 1934, the Sir Mortimer B. Davis Jewish General Hospital (JGH), a McGill University teaching hospital, has provided "Care for All," serving patients from diverse religious, linguistic and cultural backgrounds in Montreal, throughout Quebec and beyond. As one of the province's largest acute-care hospitals, the JGH has achieved a reputation for excellence in key medical specialties by continually expanding and upgrading its facilities for clinical treatment and teaching, as well as research at the Lady Davis Institute for Medical Research.

Quick facts:

- 637 beds
- 65,000 ER visits per year - one of the three busiest hospitals in Quebec
- 22,000 patients/year
- 1,000+ Physicians

powered by SpeechMagic:

A department-wide (Emergency Room) wireless speech recognition system using PDAs as dictation devices; integrated with central ER and ADT system. A first in the management of ER documentation.

On the horizon:

Front-end speech recognition roll-out for 1,000+ users.

Customer Story

Thanks to the popular TV series, ER, the emergency room seems a familiar place to many of us: bustling with activity and noise - patients, nurses and physicians always on the move. But what looks cool on TV can be challenging in reality, especially when it comes to documenting care in an overcrowded, noisy environment. This is what decided Dr. Stephen Rosenthal of Montreal's Sir Mortimer B. Davis - Jewish General Hospital to introduce a wireless document creation and management system that uses PDA devices and speech recognition to accelerate the delivery of critical information at the point of care. Now, doctors and nurses are where they want to be: with patients. And up-to-date reports are available to other clinical staff prior to the physician leaving at the end of their shift.

Emergency physicians are provided with up-to-date patient data on their PDAs – any place, any time.

The daily work of an ER physician

“The Jewish General Hospital operates one of the busiest emergency departments in Quebec, and we are often at 150% capacity,” explains Dr. Rosenthal. “Physicians are everywhere, patients are everywhere - you do one step, you’re stopped four times.” Radiologists have a dedicated room, a desk and a computer, where they sit down, read the film and dictate their reports. In the ER, everybody is on the move, says Rosenthal: “We need to be with patients, we need to be mobile; we can’t be tied to a desk.”

Despite or rather because of the fast-paced nature of this department, physicians need structured processes. “Patients are often in a critical condition, and we’re trying to put together the pieces of a puzzle. We follow a certain track, if we’re stuck we go back to the beginning and ‘debug’. Conditions change and evolve, lab results lead to new findings – all of this needs to be documented,” explains Dr. Rosenthal.

“We need to be with patients, we need to be mobile; we can’t be tied to a desk.”

A “joint mission”

The hospital had originally implemented DigiDictate-CE from Crescendo in 2003. Instead of having to leave the patient, go to a phone, type in a number and dictate, DigiDictate-CE allowed physicians to simply take the PDA out of their pocket, select a patient from the list and dictate. The application also offers all the traditional dictation functions (play, edit, insert, overwrite, delete, and add cue marks) required to edit voice files directly from the PDA.

Already a great relief to the stretched ER resources, the digital dictation system was taken one step further with the integration of speech recognition technology. Together with his provider of choice, Crescendo Systems Corporation, Dr. Rosenthal has turned his vision into reality: “I’m very people oriented. To me people are more important than products because it is they who make things work. Together with the Crescendo team, we’ve been able to build something that’s top-quality.”

The Montreal-based company offers SpeechMagic, the industrial grade speech recognition technology from Philips, as part of its portfolio of healthcare software solutions. “Dr. Rosenthal provided us with valuable insight, which allowed us to develop, as a team, a first-of-its-kind system in North America,” said Costa Mandilaras, president and co-founder of Crescendo. “We embarked on a joint mission: they have the technology, we have the insight. Workflows, needs and requirements are only understood by the people who work with the system on a daily basis,” adds Dr. Rosenthal.

Speaking at the Philips partner event. A North American first, internationally acclaimed.

Walk n talk

With their PDAs linked to the speech recognition server, physicians have a 24/7 solution. The tremendous noise levels don’t affect recognition quality, they say, neither does the large vocabulary needed to describe the variety of conditions typically found in an emergency room. Corrections are minimal, making the whole documentation loop much faster. But the biggest benefit is that the ER now has documents that are readable, searchable and that deliver suitable information for the electronic chart.

All recordings are streamed live to the central SpeechMagic server; no information is ever stored locally. If a PDA is lost, it’s a hardware loss – patient data or recordings are safely stored on the central server at all times.

Dr. Rosenthal underlined that the Jewish General Hospital’s system is 100% future-proof and delivers the foundation for evidence-based medicine, because it leads to searchable documents with standardized information. Physicians can look for infections, allergies to antibiotics, and so on. “I want to know what’s going on and why; I can’t search scribbled notes,” said Dr. Rosenthal in a presentation at the Philips’ partner event in Berlin, Germany, where he was invited to speak to more than 150 speech recognition experts from around the world. “Scribbling is a common source of errors, he said, but still, it’s state-of-the-art in most ER departments around the world.”

As the President of Emergency Specialists in Quebec and a member of the standards committee of Inflow Health Canada for Interoperable EHR, Dr. Rosenthal’s vision reaches far beyond the Montreal hospital’s walls. “Standardizing information with the help of speech recognition can help eliminate the lack of immediate access, providing physicians with better decision support across provinces, even countries”, he noted.

Good is what’s good for the user

Dr. Rosenthal says he only gives technology to his team when he feels comfortable with it. “If you have something successful, people want to get on board.” Testing the system on the users doesn’t work – the solution must be robust and solid before it goes live.

Success breeds success

Other departments are now looking to follow the emergency room. Dr. Rosenthal is now sharing best-practice procedures for a hospital-wide system, flexible enough to meet the specific requirements of every department. “Not everybody needs a PDA, not everybody needs speech recognition, you need to build in flexibility,” he says. Some might want handwriting recognition on tablet PCs, others will need to fill in standard forms using voice commands. “And all of this is OK.” In a first step, the emergency inpatient unit located floors above Dr. Rosenthal’s emergency room, has introduced the PDA-based wireless speech recognition system.

“Standardizing information with the help of speech recognition can help eliminate the lack of immediate access, providing physicians with better decision support across provinces, even countries”
